There you will find important information about the lecture, documents, exercises et cetera.

**Lecture:** Prof. Dix  
**Labs:** T. Behrens, M. Köster  
**Exam:** Oral exams on demand.
About this lecture

This course gives a first introduction to multi-agent systems for Bachelor students. Emphasis is put on applications and programming MAS, not on theory. After some general introduction of agent systems, we consider one programming language together with a platform for developing agents: 2APL. Students are grouped into teams and implement agent teams for solving a task on our agent contest platform. These teams fight against each other. The winning team will be determined in a competition and get a price.

My thanks go to Tristan Behrens, Michael Köster and our students who prepared the lab work and also some of the slides of this course. In addition, Mehdi Dastani provided me with some slides.

Lecture Overview

1. Week: Chapter 1, Introduction
2. Week: Chapter 2, Basic Notions
3. Week: Chapter 3, Scenarios + Chapter 4, 2APL
4. Week: Chapter 4, 2APL

Chapter 1. Introduction

Introduction

1.1 Why Agents?
1.2 Intelligent Agents
1.3 Formal Description
1. Introduction

Content of this chapter:

We are setting the stage for a precise discussion of agency. From informal concepts to (more or less) mathematical definitions.

1. **MAS** versus Distributed AI (DAI),
2. Environment of agents,
3. **Agents** and other frameworks,
4. Runs as characteristic behaviour,
5. state-based versus standard agents.
1. Introduction

1. Why Agents?

1.1 Why Agents?
Three Important Questions

(Q1) What is a (software) agent?
(Q2) If some program $P$ is not an agent, how can it be transformed into an agent?
(Q3) If (Q1) is clear, what kind of Software Infrastructure is needed for the interaction of agents? What services are necessary?
Definition 1.1 (Distributed Artificial Intelligence (DAI))

The area investigating systems, where several autonomous acting entities work together to reach a given goal.

The entities are called Agents, the area Multiagent Systems.

- **New site:** http://multiagentcontest.org
Example 1.18 (Agent Contest: Chasing Cows (2))

Figure 13: Chasing Cows 2008
Why do we need them?

Information systems are **distributed, open, heterogenous**. We therefore need **intelligent, interactive agents**, that act autonomously.
(Software) Agent: Programs that are implemented on a platform and have sensors and effectors to read from and make changes to the environment, respectively.

Intelligent: Performance measures, to evaluate the success. Rational vs. omniscient, decision making

Interactive: with other agents (software or humans) by observing the environment.

Coordination: Cooperation vs. Competition
1. Why Agents?

MAS versus Classical DAI

**MAS:** Several Agents coordinate their knowledge and actions (semantics describes this).

**DAI:** Particular problem is divided into smaller problems (nodes). These nodes have common knowledge. The solution method is given.

Attention:

Today DAI is used synonymously with MAS.

1. Introduction

1. Why Agents?
1. Introduction

1. Why Agents?

10 Desiderata

1. *Agents are for everyone!* We need a method to agentise given programs.

2. Take into account that *data is stored in a wide variety of data structures, and data is manipulated by an existing corpus of algorithms.*

3. A theory of agents must *not* depend upon the set of actions that the agent performs. Rather, the set of actions that the agent performs must be a *parameter* that is taken into account in the semantics.
10 Desiderata

4. Every (software) agent should execute actions based on some *clearly articulated* decision policy. A *declarative* framework for articulating decision policies of agents is imperative.

5. Any agent construction framework must allow agents to *reason*:
   - Reasoning about its beliefs about other agents.
   - Reasoning about uncertainty in its beliefs about the world and about its beliefs about other agents.
   - Reasoning about time.

These capabilities should be viewed as *extensions* to a core agent action language.
1. Introduction

1. Why Agents?

10 Desiderata

6. Any infrastructure to support multiagent interactions *must* provide security.

7. While the efficiency of the code underlying a software agent cannot be guaranteed (as it will vary from one application to another), guarantees are needed that provide information on the performance of an agent relative to an oracle that supports calls to underlying software code.
1. Introduction

1. Why Agents?

10 Desiderata

8. We must identify efficiently computable fragments of the general hierarchy of languages alluded to above, and our implementations must take advantage of the specific structure of such language fragments.

9. A critical point is reliability—there is no point in a highly efficient implementation, if all agents deployed in the implementation come to a grinding halt when the agent “infrastructure” crashes.
1. Introduction

1. Why Agents?

10. Desiderata

The only way of testing the applicability of any theory is to build a software system based on the theory, to deploy a set of applications based on the theory, and to report on experiments based on those applications.
1.2 Intelligent Agents
Definition 1.19 (Agent $a$)

An agent $a$ is anything that can be viewed as perceiving its environment through sensor and acting upon that environment through effectors.
Definition 1.20 (Rational Agent, Omniscient Agent)

A **rational agent** is one that does the **right thing** (Performance measure determines how successful an agent is).

A **omniscient agent** knows the actual outcome of his actions and can act accordingly.

Attention:

A rational agent is in general not omniscient!
1. Introduction

2. Intelligent Agents

Question

What is the **right thing** and what does it depend on?

1. **Performance measure** (as objective as possible).
2. **Percept sequence** (everything the agent has received so far).
3. **The agent’s knowledge** about the environment.
4. **How** the agent can act.
Definition 1.21 (Ideal Rational Agent)

For each possible percept-sequence an ideal rational agent should do whatever action is expected to maximize its performance measure (based on the evidence provided by the percepts and built-in knowledge).
1. Introduction

2. Intelligent Agents

Mappings:

set of percept sequences $\mapsto$ set of actions

can be used to describe agents in a mathematical way.

Hint:

Internally an agent is

agent = architecture + program

AI is engaged in designing agent programs

Prof. Dr. Jürgen Dix · Department of Informatics, TUC
Question:
How do environment properties influence agent design?

**Definition 1.22 (Properties of the Environment)**

**Accessible/Inaccessible:** If not completely accessible, one needs internal states.

**Deterministic/Indeterministic:** An inaccessible environment might seem indeterministic, even if it is not.

**Episodic/Nonepisodic:** Percept-Action-Sequences are independent from each other. Closed episodes.

**Static/Dynamic:** While the agent is thinking, the world is the same/changing. **Semi-dynamic:** The world does not change, but the performance measure.

**Discrete/Continous:** Density of observations and actions. Relevant: Level of granularity.

xbiff, software demons are agents (not intelligent).

Definition 1.23 (Intelligent Agent)

An intelligent agent is an agent with the following properties:

1. **Autonomous**: Operates without direct intervention of others, has some kind of control over its actions and internal state.
2. **Reactive**: Reaction to changes in the environment at certain times to reach its goals.
3. **Pro-active**: Taking the initiative, being goal-directed.
4. **Social**: Interaction with others to reach the goals.
Pro-active alone is not sufficient (C-Programs): The environment can change during execution.

Socialisation: coordination, communication, (negotiation) skills.

Difficulty: right balance between pro-active and reactive!
Agents vs. Object Orientation

Objects have

1. a state (encapsulated): control over internal state
2. message passing capabilities

Java: private and public methods.

- Objects have control over their state, but **not over their behaviour**.
- An object can **not prevent others to use** its public methods.
1. Introduction

2. Intelligent Agents

Agents call other agents and request them to execute actions.

- Objects do it for free, agents do it for money.
- No analoga to reactive, pro-active, social in OO.
- MAS are multi-threaded or even multi-processed: each agent has a control thread or is a new process. (In OO only the system as a whole possesses one.)
A simple agent program:

```python
function SKELETON-AGENT(percept) returns action
    static: memory, the agent’s memory of the world
    memory ← UPDATE-MEMORY(memory, percept)
    action ← CHOOSE-BEST-ACTION(memory)
    memory ← UPDATE-MEMORY(memory, action)
    return action
```
In theory everything is trivial:

**function** `TABLE-DRIVEN-AGENT( percept)` **returns** `action`

**static:** `percepts`, a sequence, initially empty

`table`, a table, indexed by percept sequences, initially fully specified

append `percept` to the end of `percepts`

`action ← LOOKUP( percepts, table)`

**return** `action`
An agent example – taxi driver:

<table>
<thead>
<tr>
<th>Agent Type</th>
<th>Perform. Measure</th>
<th>Environment</th>
<th>Actuators</th>
<th>Sensors</th>
</tr>
</thead>
<tbody>
<tr>
<td>Taxi driver</td>
<td>Safe, fast, legal, maximize profits</td>
<td>Roads, other traffic, pedestrians, customers</td>
<td>Steering, accelerator, brake, signal, horn</td>
<td>Cameras, sonar, GPS odometer, engine sensors</td>
</tr>
</tbody>
</table>

Table 2: PEAS description of the task environment for an automated taxi
Some examples:

1. **Production rules:** If the driver in front hits the breaks, then hit the breaks too.

   ```
   function SIMPLE-REFLEX-AGENT(percept) returns action 
   static: rules, a set of condition-action rules
   
   state ← INTERPRET-INPUT(percept)
   rule ← RULE-MATCH(state, rules)
   action ← RULE-ACTION[rule]
   return action
   ```
**Agents as Intentional Systems**

**Intentions**: Agents are endowed with **mental states**.

Matthias took his umbrella because he *believed* it was going to rain. Kjeld attended the MAS course because he *wanted* to learn about agents.

An **intentional system** describes entities whose behaviour can be predicted by the method of attributing beliefs, desires and rational acumen.
1.3 Formal Description
A first mathematical description

At first, we want to keep everything as simple as possible.

Agents and environments

An agent is *situated* in an environment and can perform actions

\[ A := \{a_1, \ldots, a_n\} \quad \text{(set of actions)} \]

and *change* the state of the environment

\[ S := \{s_1, s_2, \ldots, s_n\} \quad \text{(set of states)} \]
1. Introduction

3. Formal Description

How does the environment (the state $s$) develop when an action $a$ is executed?

We describe this with a function

$$\text{env} : S \times A \rightarrow 2^S.$$ 

This includes non-deterministic environments.
1. Introduction

3. Formal Description

How do we describe agents?

We could take a function \( \text{action} : S \rightarrow A \).
Question:
How can we describe an agent, now?

Definition 1.24 (Purely Reactive Agent)
An agent is called purely reactive, if its function is given by

\[
\text{action} : S \rightarrow A.
\]
This is too weak!

Take the whole history (of the environment) into account: $s_0 \rightarrow a_0 \ s_1 \rightarrow a_1 \ldots s_n \rightarrow a_n \ldots$

The same should be done for $env$!
This leads to agents that take the whole sequence of states into account, i.e.

action : \( S^* \longrightarrow A \).

We also want to consider the actions performed by an agent. This requires the notion of a run (next slide).
We define the run of an agent in an environment as a sequence of interleaved states and actions:

**Definition 1.25 (Run \( r, R = R^{act} \cup R^{state} \))**

A run \( r \) over \( A \) and \( S \) is a finite sequence

\[
\begin{align*}
  r : s_0 &\rightarrow a_0 s_1 \rightarrow a_1 \ldots s_n \rightarrow a_n \ldots
\end{align*}
\]

Such a sequence may end with a state \( s_n \) or with an action \( a_n \): we denote by \( R^{act} \) the set of runs ending with an action and by \( R^{state} \) the set of runs ending with a state.
Definition 1.26 (Environment, 2. version)

An environment $Env$ is a triple $\langle S, s_0, \tau \rangle$ consisting of

1. the set $S$ of states,
2. the initial state $s_0 \in S$,
3. a function $\tau : \mathbb{R}^{act} \rightarrow 2^S$, which describes how the environment changes when an action is performed (given the whole history).
**Definition 1.27 (Agent \(a\))**

An agent \(a\) is determined by a function

\[
\text{action} : R^{state} \rightarrow A,
\]

describing which action the agent performs, given its current history.

**Important:**

An agent system is then a pair \(a = \langle \text{action}, Env \rangle\) consisting of an agent and an environment. We denote by \(R(a, Env)\) the set of runs of agent \(a\) in environment \(Env\).
Definition 1.28 (Characteristic Behaviour)

The **characteristic behaviour** of an agent $a$ in an environment $Env$ is the set $R$ of all possible runs $r : s_0 \rightarrow_{a_0} s_1 \rightarrow_{a_1} \ldots s_n \rightarrow_{a_n} \ldots$ with:

1. for all $n$: $a_n = \text{action}(\langle s_0, a_0, \ldots, a_{n-1}, s_n \rangle)$,
2. for all $n > 0$:

   $s_n \in \tau(s_0, a_0, s_1, a_1, \ldots, s_{n-1}, a_{n-1})$.

For deterministic $\tau$, the relation “$\in$” can be replaced by “=”.
Important:

The formalization of the characteristic behaviour is dependent of the concrete agent type. Later we will introduce further behaviours (and corresponding agent designs).
Two agents \( a, b \) are called \textit{behaviourally equivalent} wrt. environment \( Env \), if
\[
R(a, Env) = R(b, Env).
\]
Two agents \( a, b \) are called \textit{behaviourally equivalent}, if they are behaviourally equivalent wrt. all possible environments \( Env \).
So far so good, but...

What is the problem with all these agents and this framework in general?

Problem

All agents have perfect information about the environment!

(Of course, it can also be seen as feature!)
1. Introduction

We need more realistic agents!

We extend our framework by perceptions:

Definition 1.29 (Actions $A$, Percepts $P$, States $S$)

$A := \{a_1, a_2, \ldots, a_n\}$ is the set of actions.

$P := \{p_1, p_2, \ldots, p_m\}$ is the set of percepts.

$S := \{s_1, s_2, \ldots, s_l\}$ is the set of states.

Note

In general, agents only have incomplete/uncertain information about the environment!
Sensors don’t need to provide perfect information!
Question: How can agent programs be designed?

There are four types of agent programs:

- Simple reflex agents
- Agents that keep track of the world
- Goal-based agents
- Utility-based agents
First try

We consider a purely reactive agent and just replace states by perceptions.

Definition 1.30 (Simple Reflex Agent)

An agent is called simple reflex agent, if its function is given by

\[
\text{action} : P \rightarrow A.
\]
A very simple reflex agent

function \textsc{Simple-Reflex-Agent}(\textit{percept}) \textbf{returns} \textit{action} \\
\textbf{static:} \textit{rules}, a set of condition-action rules \\
\textit{state} \leftarrow \textsc{Interpret-Input}(\textit{percept}) \\
\textit{rule} \leftarrow \textsc{Rule-Match}(\textit{state}, \textit{rules}) \\
\textit{action} \leftarrow \textsc{Rule-Action}[\textit{rule}] \\
\textbf{return} \textit{action}
A simple reflex agent with memory

**function** REFLEX-AGENT-WITH-STATE(*percept*) **returns** action

**static:** state, a description of the current world state

rules, a set of condition-action rules

\[
\begin{align*}
state & \leftarrow UPDATE-STATE(state, percept) \\
rule & \leftarrow RULE-MATCH(state, rules) \\
action & \leftarrow RULE-ACTION[rule] \\
state & \leftarrow UPDATE-STATE(state, action) \\
return & action
\end{align*}
\]
As before, let us now consider sequences of percepts:

**Definition 1.31 (Standard Agent α)**

A *standard agent* α is given by a function

\[
\text{action} : P^* \rightarrow A
\]

together with

\[
\text{see} : S \rightarrow P.
\]

An agent is thus a pair \(\langle\text{see}, \text{action}\rangle\).
1. Introduction

3. Formal Description

**Definition 1.32 (Indistinguishable)**

Two different states \( s, s' \) are **indistinguishable** for an agent \( a \), if \( \text{see}(s) = \text{see}(s') \).

The relation “indistinguishable” on \( S \times S \) is an **equivalence** relation.

What does \( |\sim| = |S| \) mean?
And what \( |\sim| = 1 \)?

As mentioned before, the characteristic behaviour has to match with the agent design!
Definition 1.33 (Characteristic Behaviour)

The characteristic behaviour of a standard agent \langle \text{see, action} \rangle in an environment $Env$ is the set of all finite sequences

$$p_0 \rightarrow a_0 \quad p_1 \rightarrow a_1 \quad \cdots \quad p_n \rightarrow a_n \quad \cdots$$

where

- $p_0 = \text{see}(s_0)$,
- $a_i = \text{action}(\langle p_0, \ldots, p_i \rangle)$,
- $p_i = \text{see}(s_i)$, where $s_i \in \tau(s_0, a_0, s_1, a_1, \ldots, s_{i-1}, a_{i-1})$.

Such a sequence, even if deterministic from the agent’s viewpoint, may cover different environmental behaviours (runs):

$$s_0 \rightarrow a_0 \quad s_1 \rightarrow a_1 \quad \cdots \quad s_n \rightarrow a_n \quad \cdots$$
Instead of using the whole history, resp. $P^*$, one can also use **internal states**
$I := \{i_1, i_2, \ldots, i_n, i_{n+1}, \ldots\}$.

**Definition 1.34 (State-based Agent $a_{state}$)**

A **state-based** agent $a_{state}$ is given by a function $\text{action} : I \rightarrow A$ together with

\[
\text{see} : S \rightarrow P, \\
\text{and} \quad \text{next} : I \times P \rightarrow I.
\]

Here $\text{next}(i, p)$ is the successor state of $i$ if $p$ is observed.
1. Introduction

3. Formal Description

Agent

Environment

- State
- How the world evolves
- What my actions do
- Condition–action rules

Sensors

- What the world is like now
- What action I should do now

Effectors
1. Introduction

3. Formal Description

Definition 1.35 (Characteristic Behaviour)

The characteristic behaviour of a state-based agent $a_{state}$ in an environment $Env$ is the set of all finite sequences

$$(i_0, p_0) \xrightarrow{a_0} (i_1, p_1) \xrightarrow{a_1} \ldots \xrightarrow{a_{n-1}} (i_n, p_n), \ldots$$

with

- $p_0 = \text{see}(s_0)$,
- $p_i = \text{see}(s_i)$, where $s_i \in \tau(s_0, a_0, s_1, a_1, \ldots, s_{i-1}, a_{i-1})$,
- $a_n = \text{action}(i_{n+1})$,
- $\text{next}(i_n, p_n) = i_{n+1}$.

Sequence covers the runs $r : s_0 \xrightarrow{a_0} s_1 \xrightarrow{a_1} \ldots$ where

- $a_j = \text{action}(i_{j+1})$,
- $s_j \in \tau(s_0, a_0, s_1, a_1, \ldots, s_{j-1}, a_{j-1})$,
- $p_j = \text{see}(s_j)$
Are state-based agents more expressive than standard agents? How to measure?

**Definition 1.36 (Environmental Behaviour of \( a_{state} \))**

The environmental behaviour of an agent \( a_{state} \) is the set of possible runs covered by the characteristic behaviour of the agent.
Theorem 1.37 (Equivalence)

Standard agents and state-based agents are equivalent with respect to their environmental behaviour.

More precisely: For each state-based agent $a_{\text{state}}$ and next storage function there exists a standard agent $a$ which has the same environmental behaviour, and vice versa.
3. Goal based agents:

This leads to **Planning**.
Chapter 2. Basic Notions

Basic Notions

2.1 Reactive Agents
2.2 BDI-Architecture
2.3 PROLOG
2. Basic Notions

Content of this chapter:

In this chapter we present some important techniques that will be used later for programming agents.

- An architecture for reactive agents, based on a subsumption.
- The BDI/Agent oriented programming-, architecture. While 2APL is not exactly based on this version of BDI, it is very similar in spirit.
- We introduce some PROLOG technology: terms, facts and rules. These are the basic ingredients for writing agents in the labs.
2.1 Reactive Agents
Idea:

Intelligent behaviour is Interaction of the agents with their environment.
It emerges through splitting in simpler interactions.
Subsumption-Architectures:

- Decision making is realized through **goal-directed behaviours**: each behaviour is an individual action. **nonsymbolic implementation**.
- Many behaviours can be applied **concurrently**. How to select between them? **Implementation through Subsumption-Hierarchies, Layers**. Upper layers represent abstract behaviour.
2. Basic Notions

1. Reactive Agents

Formal Model:

- **see**: as up to now, but close relation between observation and action: no transformation of the input.

- **action**: Set of behaviors and inhibition relation.
  
  \[ \text{Beh} := \{ \langle c, a \rangle : c \subseteq P, \ a \in A \}. \]

  \( \langle c, a \rangle \) “fires” if \( \text{see}(s) \in c \) (\( c \) stands for “condition”).

  \( \prec \subseteq A_{rules} \times A_{rules} \)

  is called inhibition-relation, \( A_{rules} \subseteq \text{Beh} \).

  We require \( \prec \) to be a total ordering.

  \( b_1 \prec b_2 \) means: \( b_1 \) inhibits \( b_2 \),

  \( b_1 \) has priority over \( b_2 \).
Function: Action Selection in the Subsumption Architecture
1. function action(p:P):A
2. var fired:℘(R)
3. var selected:A
4. begin
5.     fired ← {(c,a) | (c,a) ∈ R and p ∈ c}
6.     for each (c,a) ∈ fired do
7.         if ¬(∃(c′,a′) ∈ fired such that (c′,a′) < (c,a)) then
8.             return a
9.         end-if
10.     end-for
11.     return null
12. end function action

Figure 5.1  Action Selection in the subsumption architecture.
Example 2.1 (Exploring a Planet)

A distant planet (asteroid) is assumed to contain gold. Samples should be brought to a spaceship landed on the planet. It is not known where the gold is. Several autonomous vehicles are available. Due to the topography of the planet there is no connection between the vehicles.

The spaceship sends off radio signals: gradient field.
2. Basic Notions

1. Reactive Agents

Low Level Behaviour:

(1) If detect an obstacle then change direction.

2. Layer:

(2) If Samples on board and at base then drop off.
(3) If Samples on board and not at base then follow gradient field.

3. Layer:

(4) If Samples found then pick them up.

4. Layer:

(5) If true then take a random walk.

With the following ordering

(1) \prec (2) \prec (3) \prec (4) \prec (5).

Under which assumptions (on the distribution of the gold) does this work perfectly?
Vehicles can communicate indirectly with each other:
- they put off, and
- pick up

radiative samples that can be sensed.
Low Level Behaviour:

(1) If detect an obstacle then change direction.

2. Layer:

(2) If Samples on board and at base then drop off.
(3) If Samples on board and not at base then drop off two radioactive crumbs and follow gradient field.

3. Layer:

(4) If Samples found then pick them up.
(5) If radioactive crumbs found then take one and follow the gradient field (away from the spaceship).

4. Layer:

(6) If true then take a random walk.

With the ordering $(1) \prec (2) \prec (3) \prec (4) \prec (5) \prec (6)$. 
2. Basic Notions

1. Reactive Agents

**Pro:** Simple, economic, efficient, robust, elegant.

**Contra:**

- Without knowledge about the environment agents need to know about the own local environment.
- Decisions only based on local information.
- How about bringing in **learning**?
- Relation between agents, environment and behaviours is not clear.
- Agents with $\leq 10$ behaviours are doable. But the more layers the more complicated to understand what is going on.
2.2 BDI-Architecture
Belief, Desire, Intention.

<table>
<thead>
<tr>
<th>Agent Control Loop Version 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. while true</td>
</tr>
<tr>
<td>2. observe the world;</td>
</tr>
<tr>
<td>3. update internal world model;</td>
</tr>
<tr>
<td>4. deliberate about what intention to achieve next;</td>
</tr>
<tr>
<td>5. use means-ends reasoning to get a plan for the intention;</td>
</tr>
<tr>
<td>6. execute the plan</td>
</tr>
<tr>
<td>7. end while</td>
</tr>
</tbody>
</table>
Agent Control Loop Version 2
1. \( B \leftarrow B_0; /* \text{ initial beliefs } */ \\
2. \text{ while true do} \\
3. \quad \text{ get next percept } \rho; \\
4. \quad B \leftarrow brf(B, \rho); \\
5. \quad I \leftarrow \text{ deliberate}(B); \\
6. \quad \pi \leftarrow \text{ plan}(B, I); \\
7. \quad \text{ execute}(\pi) \\
8. \text{ end while}
Three main questions:

**Deliberation:** How to deliberate?

**Planning:** Once committed to something, how to reach the goal?

**Replanning:** What if during execution of the plan, things are running out of control and the original plan fails?
Belief 1: Making money is important.
Belief 2: I like computing.
Desire 1: Graduate in Computer Science.
Desire 2 (Int.): Pass the BSc.
Desire 3: Graduate in time, marks are unimportant.
New Belief: Money is not so important after all.
New Belief: Working scientifically is fun.
Desire 4: Pursue an academic career.
Desire 5 (Int.): Make sure to graduate with honours.
Desire 6 (Int.): Study abroad.
Intentions are the most important thing.

Beliefs and intentions generate desires.

Desires can be inconsistent with each other.

Intentions are recomputed based on the current intentions, desires and beliefs.

Intentions should persist, normally.

Beliefs are constantly updated and thus generate new desires.

From time to time intentions need to be re-examined.
Agent Control Loop Version 3

1. 
2. \( B := B_0; \)
3. \( I := I_0; \)
4. while true do
5. \( \text{get next percept } \rho; \)
6. \( B := brf(B, \rho); \)
7. \( D := options(B, I); \)
8. \( I := filter(B, D, I); \)
9. \( \pi := plan(B, I); \)
10. \( \text{execute}(\pi) \)
11. end while
Deliberation has been split into two components:

1. Generate options (desires).
2. Filter the right intentions.

\[(B, D, I) \text{ where } B \subseteq \text{Bel}, D \subseteq \text{Des}, I \subseteq \text{Int}\]

$I$ can be represented as a stack (priorities are available)
An agent has commitments both to **end**: the wishes to bring about, **means**: the mechanism to achieve a certain state of affairs.

⇝ Means-end reasoning.

What is wrong with our current control loop?

It is overcommitted to both means and end. No way to replan if something goes wrong.
2. Basic Notions

2. BDI-Architecture

Agent Control Loop Version 4
1. 
2. $B := B_0$;
3. $I := I_0$;
4. while true do
   5. get next percept $\rho$;
   6. $B := \text{brf}(B, \rho)$;
   7. $D := \text{options}(B, I)$;
   8. $I := \text{filter}(B, D, I)$;
   9. $\pi := \text{plan}(B, I)$;
   10. while not empty($\pi$) do
       11. $\alpha := \text{hd}(\pi)$;
       12. execute($\alpha$);
       13. $\pi := \text{tail}(\pi)$;
       14. get next percept $\rho$;
       15. $B := \text{brf}(B, \rho)$;
       16. if not sound($\pi, I, B$) then
           17. $\pi := \text{plan}(B, I)$
       end-if
   18. end-while
19. end-while
2. Basic Notions

2. BDI-Architecture

- goal/intention/task
- state of environment
- possible actions

plan to achieve goal

planner
What is a plan, a planning algorithm?

**Definition 2.2 (Plan)**

A \textit{plan} $\pi$ is a list of primitive actions. They lead, by applying them successively, from the \textit{initial state} to the \textit{goal state}.

Still overcommitted to intentions!
Agent Control Loop Version 5

2. \( B := B_0; \)
3. \( I := I_0; \)
4. \textbf{while true do}
5. \hspace{1em} get next percept \( \rho; \)
6. \hspace{1em} \( B := brf(B, \rho); \)
7. \hspace{1em} \( D := \text{options}(B, I); \)
8. \hspace{1em} \( I := \text{filter}(B, D, I); \)
9. \hspace{1em} \( \pi := \text{plan}(B, I); \)
10. \hspace{1em} \textbf{while not empty}(\pi)
\hspace{1em} \hspace{1em} or succeeded\((I, B)\)
\hspace{1em} \hspace{1em} or impossible\((I, B)\) do
11. \hspace{2em} \( \alpha := \text{hd}(\pi); \)
12. \hspace{2em} \text{execute}(\alpha); \)
13. \hspace{2em} \( \pi := \text{tail}(\pi); \)
14. \hspace{1em} get next percept \( \rho; \)
15. \hspace{1em} \( B := brf(B, \rho); \)
16. \hspace{1em} \text{if not sound}(\pi, I, B) \text{ then}
17. \hspace{2em} \( \pi := \text{plan}(B, I); \)
18. \hspace{20em} \text{end-if}
19. \hspace{1em} \text{end-while}
20. \text{end-while}
Still limited in the way the agent can reconsider its intentions.
Agent Control Loop Version 6
1. 
2. \( B := B_0 \); 
3. \( I := I_0 \); 
4. while true do
5. \( \text{get next percept } \rho; \)
6. \( B := brf(B, \rho); \)
7. \( D := \text{options}(B, I); \)
8. \( I := \text{filter}(B, D, I); \)
9. \( \pi := \text{plan}(B, I); \)
10. while not (\text{empty}(\pi)
      or \text{succeeded}(I, B)
      or \text{impossible}(I, B)) do
11. \( \alpha := \text{hd}(\pi); \)
12. \( \text{execute}(\alpha); \)
13. \( \pi := \text{tail}(\pi); \)
14. \( \text{get next percept } \rho; \)
15. \( B := brf(B, \rho); \)
16. \( D := \text{options}(B, I); \)
17. \( I := \text{filter}(B, D, I); \)
18. if not \( \text{sound}(\pi, I, B) \) then
19. \( \pi := \text{plan}(B, I) \)
20. end-if 
21. end-while 
22. end-while
But reconsidering intentions is **costly**.

**Pro-active vs. reactive**

**Extreme:** stubborn agents, unsure agents.

**What is better?** Depends on the environment.

Let $\gamma$ the **rate of world change**.

1. $\gamma$ small: stubbornness pays off.
2. $\gamma$ big: unsureness pays off.

**What to do?**

**Meta-level control**
Agent Control Loop Version 7

1. $B := B_0$;
2. $I := I_0$;
3. while true do
   4.      get next percept $\rho$;
   5.      $B := brf(B, \rho)$;
   6.      $D := \text{options}(B, I)$;
   7.      $I := \text{filter}(B, D, I)$;
   8.      $\pi := \text{plan}(B, I)$;
   9.      while not (empty($\pi$)
   10.      or succeeded($I, B$)
   11.      or impossible($I, B$)) do
          11.      $\alpha := \text{hd}(\pi)$;
          12.      execute($\alpha$);
          13.      $\pi := \text{tail}(\pi)$;
          14.      get next percept $\rho$;
          15.      $B := brf(B, \rho)$;
          16.      if reconsider($I, B$) then
          17.          $D := \text{options}(B, I)$;
          18.          $I := \text{filter}(B, D, I)$;
          19.      end-if
          20.      if not sound($\pi, I, B$) then
          21.          $\pi := \text{plan}(B, I)$
          22.      end-if
   23.      end-while
24. end-while
2. Basic Notions

2.3 PROLOG
Prolog

Prolog = programmation en logique

is a logic programming language that is based on Horn clauses and resolution. We also use negation as failure to deal with incomplete information.

Programming constructs of Prolog that are important for our course are:

- terms,
- facts (also called atoms), and
- rules.

Other important notions are queries, and predefined constructs like arithmetical expressions, and lists.
2. Basic Notions

Terms

- **Constants** starting with a digit or a lower-case letter: 
  abraham, lot, milcah, 1, 2, 3, ... 

- **Variables** starting with an upper-case letter: 
  X, Y, List, Family, ... 

- **(Compound) Terms** $f(t_1, t_2, \ldots, t_n)$ composed using constants, variables and functors: 
  $s(0), s(s(0)), f(c_1, f(c_1, f(s(0), c_2))),$
  \texttt{first\_name\_of(einstein)}, \texttt{father\_of(X)}, ... 

- **Ground Terms** are terms without variables. They are also called **fully instantiated**.
Facts (Atoms)

They express that a relation holds between objects: They can be true or not.

\textit{father}(terach, abraham).
\textit{father}(abraham, isaac).
\textit{father}(abraham, ismael).
\textit{father}(isaac, esau).
\textit{father}(isaac, jakob).
\textit{father}(jakob, dina).

\textit{father} is also called a \textbf{binary predicate}.
Similarly, facts are sometimes called predicates.
Facts (Atoms) (2)

- *father(Y, father(Y, X))* is **meaningless and not well-formed**.
- One could consider *plus(X, Y)* as a binary function.
- Then *plus(1, plus(1, 1))* would make sense (and evaluate to something like 3, if this were available in the language).
Facts (Atoms) (3)

- A belief base always consists of facts.
- If a belief base does not contain a particular atom, say `father(isaac, terach)`, then we can also say that “not `father(isaac, terach)`” is true.
- Such negated facts are also called negated atoms. We use the notion literal, to denote an atom or its negation.
- Therefore a belief base is always consistent: It can not contain any contradictory information.
Rules, Clauses (1)

To define **new predicates**:

- $\text{son}(X, Y) : \leftarrow \text{father}(Y, X), \text{male}(X)$.
- $\text{daughter}(X, Y) : \leftarrow \text{parent}(Y, X), \text{female}(X)$.
- $\text{grandfather}(X, Y) : \leftarrow \text{father}(X, Z), \text{parent}(Z, Y)$.
- $\text{grandmother}(X, Y) : \leftarrow \text{mother}(X, Z), \text{parent}(Z, Y)$.
- $\text{parent}(X, Y) : \leftarrow \text{father}(X, Y)$.
- $\text{parent}(X, Y) : \leftarrow \text{mother}(X, Y)$.
- $\text{sibling}(X, Y) : \leftarrow \text{parent}(Z, X), \text{parent}(Z, Y)$.
Rules, Clauses (2)

They are also used to state important properties and relations between predicates:

\[
\begin{align*}
\text{male}(Y) & : - \quad \text{father}(Y, X). \\
\text{female}(Y) & : - \quad \text{mother}(Y, X).
\end{align*}
\]
Queries

Given a set of rules and some facts (in a belief base), it is interesting to know whether something can be deduced from that (see the Wumpus example). We can ask queries: They can be true, they can fail, or, if they contain variables, they can result in an instantiation of the variables.

- son(isaac, abraham)? → true
- plus(1, 1, 2)? → true
- daughter(X, lea)? → true, X=dina
- grandmother(X, esau)? → true, X=sarah
- siblings(esau, jakob)? → true
- mother(terach, Y)? → false?
- plus(1, 1, Y)? → true, Y=2
- plus(X, X, Y)? → true, X=0, Y=0
How to interpret the rules?

**Example 2.3 (SLD-Resolution)**

Let a program consist of the following rules

1. \( p(X, Z) : \neg q(X, Y), p(Y, Z) \)
2. \( p(X, X) \).
3. \( q(a, b) \).

The query \( Q \) we are interested in is “\( p(X, b) \)”.
I.e. we are looking for all instances (terms) \( t \)
for \( X \) such that \( p(t, b) \) follows from the program.
2. Basic Notions

3. PROLOG

Figure 14: A finite SLD-Tree

\[ p(X, b) \]

\[ q(X, Y), p(Y, b) \]

\[ p(b, b) \]

\[ q(b, u), p(u, b) \]

\[ [X/b] \] "Success"

\[ [X/a] \] "Success"

"Failure"
Lists

We often use \texttt{lists} and consider \([\cdot]\) as a \texttt{function symbol}, written in \texttt{infix notation}.

\[
\begin{align*}
[] & \quad \text{empty list} \\
[a] & \quad \text{list with one element} \\
[a, b] & \quad \text{list with two elements} \\
[a, b, c] & \quad \text{list with three elements} \\
[a, [b, c]] & \quad \text{list of lists}
\end{align*}
\]
Predicates for lists

We assume we have a list of **built-in** predicates:

- \( \text{member}(a, [a, b, c]) \)  
  - membership
- \( \text{member}(X, [a, b, c]) \)  
  - membership
- \( \text{prefix}([a, b], [a, b, c]) \)  
  - prefix
- \( \text{suffix}([b, c], [a, b, c]) \)  
  - suffix
- \( \text{sublist}([b], [a, b, c]) \)  
  - sublist
- \( \text{append}([a, b], [c, d], [a, b, c, d]) \)  
  - appending two lists
Append

Suppose for a moment we do not have the `append` predicate available.

How can we define it using rules?

\[
\text{append}([], X, X) : - \\
\text{append}([X|Y], Z, [X|T]) : - \text{append}(Y, Z, T)
\]
Order of atoms

How can we define the \texttt{reverse} of a list?

\textbf{Example 2.4 (Termination depends on the order)}

Consider the following two programs:

(1) \texttt{reverse}([X|Y], Z) : − \texttt{append}(U, [X], Z), \texttt{reverse}(Y, U)

(2) \texttt{reverse}([X|Y], Z) : − \texttt{reverse}(Y, U), \texttt{append}(U, [X], Z)

together with the above definition for \texttt{append} and the query “\(Q:\texttt{reverse}([a|X], [b, c, d, b])\)”. 
Order of atoms (cont.)

- The first program (1) leads to:
  \[ Q^1 : \text{append}(U, [a], [b, c, d, b]), \text{reverse}(X, U) \]

- The second program (2) leads to:
  \[ Q^2 : \text{reverse}(X, U), \text{append}(U, [a], [b, c, d, b]) \]

- We get different results using a naive execution!

- This problem has been solved: Just do not care too much about the ordering!
**not**: negation-as-failure (1)

`not` has a very special meaning.

\[
\text{reachable}(X) \quad : \quad \neg \text{edge}(X, Y), \text{reachable}(Y).
\]

\[
\text{edge}(a, b).
\]

\[
\text{edge}(b, a).
\]

\[
\text{edge}(c, d).
\]

\[
\text{out_of_reach}(X) \quad : \quad \textbf{not} \text{ reachable}(X).
\]

What about the query `out_of_reach(c)`?
**not**: negation-as-failure (2)

Remember $female(X), male(X)$. These predicates exclude each other. **How to express this with rules?**

\[
\begin{align*}
female(X) &: \quad \textbf{not} \ male(X). \\
male(X) &: \quad \textbf{not} \ female(X).
\end{align*}
\]

This ensures that we always have $male(c)$ or $female(c)$ in a belief base, but never both (unless explicitly stated).
System Functions

These (and other) functions are pre-defined:

- **Sum:** $1 + 1$
- **Subtract:** $2 - 3$
- **Quotient:** $5/8$
- **Multiply:** $13 \times 21$
- **Minus:** $-34$
- **Absolute:** $\text{abs}(2)$
- **Square root:** $\sqrt{16}$
- **Pi:** $\pi$
- **Integer:** $\text{int}(2.1)$
- **Random:** $\text{random}(16)$
- **Time:** $\text{cputime}$
- **Ceiling:** $\text{ceil}(2.5)$
- **Floor:** $\text{floor}(2.5)$
- **Assign:** $\text{is}(X, 3)$

One has to make sure that variables are instantiated accordingly, at the time the predicate is evaluated.

3. Some Scenarios

Chapter 3. Some Scenarios

Some Scenarios

3.1 Wumpus
3.2 Harry and Sally
3.3 Agent Contest
3. Some Scenarios

Content of this chapter:

We present two interesting scenarios and our agent contest.

**Wumpus**: a simple yet difficult to solve deterministic (but incomplete) environment.

**Harry and Sally**: a simple test case for two agents that **communicate**.

**Agent Contest**: where agents need to **collaborate** together to achieve a goal in an indeterministic environment.

(a)
Definition of suitable predicates

\[ S(i, j) \quad \text{cell} (i, j) \text{ stenches} \]
\[ B(i, j) \quad \text{cell} (i, j) \text{ breezes} \]
\[ G(i, j) \quad \text{cell} (i, j) \text{ glitters} \]
\[ P(i, j) \quad \text{cell} (i, j) \text{ is a pit} \]
\[ W(i, j) \quad \text{cell} (i, j) \text{ contains a Wumpus} \]

The first three predicates correspond to percepts of the agent.

The last two predicates can be determined based on the observations of the agent and the path it has taken.
General background knowledge

\[ \neg S(1, 1) \rightarrow (\neg W(1, 1) \land \neg W(1, 2) \land \neg W(2, 1)) \]

\[ \neg S(2, 1) \rightarrow (\neg W(1, 1) \land \neg W(2, 1) \land \neg W(2, 2) \land \neg W(3, 1)) \]

\[ \neg S(1, 2) \rightarrow (\neg W(1, 1) \land \neg W(1, 2) \land \neg W(2, 2) \land \neg W(1, 3)) \]

\[ S(1, 2) \rightarrow (W(1, 3) \lor W(1, 2) \lor W(2, 2) \lor W(1, 1)) \]

+ many more!!

These have to be rewritten in the form of rules \( a : \neg b \).
Belief base in initial state:
\[ \neg W(1, 1), \neg S(1, 1), \neg Pit(1, 1), \neg B(1, 1) \]

Belief base after first move:
\[ \neg W(1, 1), \neg S(1, 1), \neg Pit(1, 1), \neg B(1, 1), \neg S(2, 1), B(2, 1) \]

Belief base after second move:
\[ \neg W(1, 1), \neg S(1, 1), \neg Pit(1, 1), \neg B(1, 1), \neg S(2, 1), B(2, 1) \]
3. Some Scenarios

1. Wumpus

Belief base after the 3rd move:

\[ \neg W(1, 1), \neg S(1, 1), \neg Pit(1, 1), \neg B(1, 1), \neg S(2, 1), B(2, 1), S(1, 2), B(2, 1), \neg B(1, 2) \]

Question:
Can we deduce that the wumpus is located at (1,3)?

Answer:
Yes. This can be done automatically using built-in features of the programming language: By querying \( W(1, 3) \) against the belief base.
Lab exercise

We will implement agents that are situated in the wumpus world in one of the lab exercises.
3. Some Scenarios

3.2 Harry and Sally
Harry and Sally

- This example is about two Agents living in a $n \times n$ grid.
- The world can contain bombs, walls and dustbins.

Sally: Searching for bombs, notifying Harry when a bomb has been found

Harry: Cleaning the grid by picking up the bombs and throwing it in a dustbin.
3. Some Scenarios

2. Harry and Sally
3. Some Scenarios

2. Harry and Sally

Details

Percepts:
- actual Position $pos(1, 1)$
- visible bombs $bomb(1, 2), bomb(3, 4), \ldots$

Actions:
- movement $north(), west(), south(), east()$
- bomb manipulation $pickup(), drop()$
- entering the environment physically $enter(1, 1, blue)$
- send a message

Roles:
- Sally explores the environment (random), looks for bombs, and informs Harry about detected bombs.
- Harry waits until Sally sends bomb positions. Once Harry becomes aware of a bomb he moves to it and picks it up.
Sally

Initial beliefs: $\emptyset$

Initial goals:
- $search(blockWorld)$

Initial plans:
- enter the environment at the position $[8, 8]$

Behavior: as long as Sally has the goal $search(blockWorld)$
1. go to a random position
2. sense visible bombs
3. if bombs are visible tell Harry about the position of the bomb
Harry

Initial beliefs: $\emptyset$

Initial goals:
- $\text{clean} (\text{blockWorld})$

Initial plans:
- enter the environment at the position $[0, 1]$

Behavior: when Harry has the goal $\text{search} (\text{blockWorld})$ and beliefs $\text{bomb} (X, Y)$
1. go to $[X, Y]$
2. pick up bomb
3. go to $[0, 0]$
4. drop bomb
Lab excercise

We will have a closer look at Harry and Sally in a lab excercise.
3.3 Agent Contest
Scenario: Gold Miners

Task: Implement a team of agents that collects more gold than the opponent.

Aim: Agents should cooperate and coordinate their actions. Agents can take on roles and split into subgroups to solve the overall task more efficiently.

Emerging behaviour instead of a hard-wired solution.

Environment: Can be quite indeterministic: percepts can be blurred, actions could fail with certain probability, ...
3. Some Scenarios

3. Agent Contest

Environment

Figure 15: Elements in the environment

- Agents
- Gold
- Obstacles
- Depot
Figure 16: Gold Miners 2006: CLIMABot (blue) vs. brazil (red)
3. Some Scenarios

3. Agent Contest

Details

Discrete Simulation: in each step do

- send perceptions to agents
- wait for agents’ actions or timeout
- let agents act

Tournament Structure:

- maximum step duration around 4 seconds
- approx. 1000 steps per simulation
- 3 simulations = 1 match
- each team plays against all others, 1 match per pair
3. Some Scenarios

3. Agent Contest

Technical details

- Grid size: 30 \times 30
- Perception failure: 1%
- Action failure: 2%
- Occupying the depot leads to teleporting the agent
Lab excercise

We will implement agent teams in the lab excercises and let the teams compete against each other. The better one wins!
Scenario: Cows and Cowboys

Task: Implement a team of agents that collects more cows than the opponent.

Aim: Agents have to cooperate and coordinate their actions. Agents can take on roles and split into subgroups to solve the overall task more efficiently. Emerging behaviour instead of a hard-wired solution.

Environment: Can be quite indeterministic: behaviour of cows, percepts can be blurred, actions could fail with certain probability, ...
3. Some Scenarios

Environment

- Cows
- Cowboys
- Corrals
- Obstacles
What is the optimal solution?

We do not know!
3. Some Scenarios

3. Agent Contest

Details

**Discrete Simulation:** in each step do
- send perceptions to agents
- wait for agents’ actions or timeout
- let agents act and move cows

**Tournament Structure:**
- maximum step duration around 4 seconds
- approx. 1000 steps per simulation
- 3 simulations = 1 match
- each team plays against all others, 1 match per pair
Agents

- fixed visibility range (square)
- actions: move to one of eight directions
Cows

- visibility range (square)
- afraid of: agents, obstacles
- feel good: near other cows and empty spaces
- actions: move to one of eight directions
- slower than agents
Map: Razoredge
Map: Cowskullmountain
Chapter 4. 2APL

2APL

4.1 Abstractions in MAS
4.2 Programming in 2APL
4.3 Syntax
Content of this chapter:

We introduce 2APL and illustrate how to construct agents using the provided syntactical constructs.

1. Abstractions: IDE, deliberation cycle, recursive plans.
2. Abstraction levels.
3. 2APL programming constructs: Bases, rule bases, operations on them.
4.1 Abstractions in MAS
Languages for Cognitive Agents (1)

**Programming Languages for MAS**

= 

**Data Structures** + **Programming Instructions**

E.g., 2APL, 3APL, Jason, Jadex, Jack

- **Data Structures** to represent mental state
  - **Beliefs**: General and specific Information about environment
  - **Goals**: Objectives that agent want to reach
  - **Events**: Observations of (environmental) changes
  - **Capabilities**: Actions that agent can perform
  - **Plans**: Procedures to achieve objectives
  - **Reasoning rules**: Reason about goals, events and plans
    - planning rules (goal → plan)
    - event rules (event → plan)
    - plan revision rules (plan → plan)
Languages for Cognitive Agents (2)

- **Programming Instructions** to process mental states
  - Select Event
  - Plan Goals
  - Select Plans
  - Execute Plans
  - Select Rules
  - Apply Rules

*Agent Interpreter* or *Agent Deliberation* is a loop consisting of such instructions. The loop determines the behavior of the agent.
Motivation (1)

- Languages for implementing MAS: Jack, Jadex, Jason, 3APL, ConGoLog, MetateM, IMPACT, CLAIM, MINERVA, Go!
- Efficient implementation of MAS architectures: Individual Cognitive Agents, Shared Environment, Multi-Agent Organisation
4. 2APL

1. Abstractions in MAS

Motivation (2)

- **Support for Programming Principles:** Recursion, Compositionality, Abstraction, Exception Handling, Encapsulation, Autonomy, Reusability, Heterogeneity, Legacy Systems

- **Integrated Development Environment (IDE):** Editor, Debugging and Monitoring Facility, Support the Development of Individual Agents, Multi-Agent Organisation, and Shared Environment
Features of 2APL (1)

Programming Constructs:

- **Multi-Agent System**: Which and how many agents to create? Which environments? Which agent can access which environment?

- **Individual Agent**: Beliefs, Goals, Plans, Events, Messages
Features of 2APL (2)

Programming Principles and Techniques:

- **Abstraction**: Procedures/Recursion in Plans
- **Error Handling**: Plan Failure and their revision by Internal Events, Execution of Critical Region of Plans
- **Legacy Systems**: Environment and External Actions
- **Encapsulation**: Including 2APL files in other 2APL files
- **Autonomy**: Adjustable Deliberation Process
Features of 2APL (3)

**Integrated Development Environment:**

- 2APL platform is built on JADE and uses related tools
- Editor with High-Lighting Syntax
- Monitoring mental attitudes of individual agents, their reasoning and communications
- Executing in one step or continuous mode
- Visual Programming of the Deliberation Process
4.2 Programming in 2APL
Interlude – Grammar Notation

- Non-terminals: \( \langle \text{zero} \rangle, \langle \text{one} \rangle, \langle \text{two} \rangle \ldots \)
- Terminals: ’’0’’, ’’1’’, ’’2’’, ...
- Rules: \( \langle \text{zeroOneZero} \rangle := ’’0’’ \ ’’1’’ \ ’’0’’ ; \)
- Choice: \( \langle \text{digit} \rangle := ’’0’’ | ’’1’’ | ’’2’’ | ’’3’’ | \ldots ; \)
- Omission or repetition:
  \( \langle \text{anystring} \rangle := \{ ’’0’’ | ’’1’’ \} ; \)
- Repetition: \( \langle \text{anystring2} \rangle := ( ’’0’’ | ’’1’’ )^{+} ; \)
- Option: \( \langle \text{oneOrOneOne} \rangle := [ ’’1’’ ] ’’1’’ ; \)

Example 4.1

Several examples on the blackboard.
2APL Platform

2APL = MAS Progr. + Agent Progr.
Abstraction Levels

**Individual Agent:** Abstraction, Situatedness, Proactivity
- Cognitive concepts: beliefs, goals, plans, actions
- Deliberation and control: sense/reason/act, reactive/pro-active

**Multi-Agent:** Social and Organizational Structures
- **Roles:** functionalities, activities, and responsibilities
- **Organizational Rules:** constraints on roles and their interactions
- **Organizational Structures:** topology of interaction patterns, control of activities

**Environment:** Resources and Services that MAS can access and control
Data Structures
Data Structures

- **Beliefs**: what the agent knows about the world
- **Belief Updates**: how the agent updates its beliefs
- **Goals**: states that the agent wants to achieve
- **Plans**: how to act
- **Events**: messages, external events from external environments

- **Planning Goal Rules**: which plan to instantiate in respect to the beliefs and goals
- **Procedural Rules**: which plans to instantiate in reaction to messages, events and abstract actions
- **Plan Repair Rules**: how to react to a failed action
4.3 Syntax
MAS Definition

\[
\langle \text{MAS}_\text{Prog} \rangle = ( \langle \text{agentname} \rangle :: \langle \text{filename} \rangle \left[ \langle \text{int} \rangle \right] \left[ \langle \text{environments} \rangle \right] )^+ ;
\]

\[
\langle \text{agentname} \rangle = \langle \text{ident} \rangle ;
\]

\[
\langle \text{filename} \rangle = \langle \text{ident} \rangle .2apl'' ;
\]

\[
\langle \text{environments} \rangle = '@'\langle \text{ident} \rangle \{ ',','\langle \text{ident} \rangle \} ;
\]

Examples:

harry : harry.2apl @blockworld
sally : sally.2apl @blockworld
unit : unit.2apl 3 @env1,env2
Agent Programs

\[
\langle AgentProg \rangle \ = \ \{ \ "Include:" \langle ident \rangle \\
\ "Beliefupdates:" \langle BelUpSpec \rangle \\
\ "Beliefs:" \langle beliefs \rangle \\
\ "Goals:" \langle goals \rangle \\
\ "Plans:" \langle plans \rangle \\
\ "PG rules:" \langle pgrules \rangle \\
\ "PC rules:" \langle pcrules \rangle \\
\ "PR rules:" \langle prrules \rangle \ \};
\]

This is how the initial state of an agent is defined.
Data Structures

- Goal Base
- Plan Base
- Event Base
- Deliberation Process
- Belief Base
- Planning Goal Rule Base
- Procedural Rule Base
- Plan Repair Rule Base
- Belief Updates
Beliefs

\[ \langle \text{belief} \rangle = ( \langle \text{ground\_atom} \rangle . | \langle \text{atom} \rangle :- \langle \text{literals} \rangle . )^+ ; \]

Example:

Beliefs:

\begin{align*}
\text{start}(0,1).
\text{bomb}(3,3).
\text{clean( blockWorld )} & :\neg \text{ not bomb}(X,Y), \\
& \text{ not carry(bomb)}. \\
\end{align*}

\[\Rightarrow\] Prolog facts and rules
Data Structures

Goal Base

Belief Base

Planning Goal Rule Base

Plan Base

Deliberation Process

Procedural Rule Base

Event Base

Belief Updates

Plan Repair Rule Base
Belief Updates

\[
\langle \text{BelUpSpec} \rangle = ( "\{"\langle \text{belquery} \rangle \}" \langle \text{beliefupdate} \rangle "\{"\langle \text{literals} \rangle \}" \})^+ ;
\]

Structure:

\{ pre \} BeliefUpdateAction \{ post \}
Belief Updates Example

**BeliefUpdates:**

\begin{align*}
\{ \text{bom} & \text{b}(X, Y) \} \\
\text{RemoveBomb}(X, Y) & \\
\{ \text{not} \ & \text{bom} (X, Y) \} & \\
\{ \text{true} \} & \\
\text{AddBomb}(X, Y) & \\
\{ \text{bom} (X, Y) \} & \\
\{ \text{carry}(\text{bom}) \} & \\
\text{Drop}( ) & \\
\{ \text{not} \ & \text{carry}(\text{bom}) \} & \\
\{ \text{not} \ & \text{carry}(\text{bom}) \} & \\
\text{PickUp}( ) & \\
\{ \text{carry}(\text{bom}) \} & \\
\end{align*}
 goals = goal \{ "", goal \} ;  
goal = ground_atom \{ "and" ground_atom \} ;  

Example: 

Goals:  

   clean( blockWorld )
Data Structures

- Goal Base
- Belief Base
- Planning Goal Rule Base
- Procedural Rule Base
- Plan Repair Rule Base
- Event Base
- Belief Updates
- Deliberation Process
- Plan Base
Plans

Plans = Basic Actions + Plan Operators
Basic Actions

An agent can
- do nothing,
- update its beliefs,
- send a message,
- act in the external environment(s),
- execute a plan,
- test its beliefs/goals,
- adopt a goal, and
- drop a goal.
Basic Actions

\[ \langle \text{baction} \rangle = \text{''skip''} \]

\[ \mid \langle \text{beliefupdate} \rangle \]
\[ \mid \langle \text{sendaction} \rangle \]
\[ \mid \langle \text{externalaction} \rangle \]
\[ \mid \langle \text{abstractaction} \rangle \]
\[ \mid \langle \text{test} \rangle \]
\[ \mid \langle \text{adoptgoal} \rangle \]
\[ \mid \langle \text{dropgoal} \rangle ; \]
Belief Update Action

- Let $T$ be the function that takes a belief update action and a belief base, and returns the modified belief base if the pre-condition of the action is entailed by the agent’s belief base.

- This function can be defined based on the specification of the belief update actions.

- If the belief update action cannot be applied, the action fails.
Belief Update Action

\[ \langle \text{beliefupdate} \rangle = \langle \text{Atom} \rangle ; \]

**Examples:**

PickUp( )

RemoveBomb( X, Y )

Applies the BeliefUpdates.
Send Action

\[ \langle sendaction \rangle = \text{"send(\"}\langle iv\rangle \text{"},\text{"}\langle iv\rangle \text{"},\text{"}\langle atom\rangle \text{"})\"}; \]
\[ \text{\textpipe} \text{"send(\"}\langle iv\rangle \text{"},\text{"}\langle iv\rangle \text{"},\text{"}\langle iv\rangle \text{"},\text{"}\langle iv\rangle \text{"},\text{"}\langle atom\rangle \text{"})\"}; \]

Example:

\text{send( harry, inform, bombAt( X1, Y1 ) )}

Informs \text{harry} that there is a bomb at a specific position.
Send Action

- An agent can send a message to another agent by means of the `send(j, p, l, o, φ)` action.
- An agent is assumed to be able to receive a message that is sent to it at any time. The received message is added to the event base of the agent.
- **Synchronized Communication**: The execution of the send action will broadcast a message which will be received by the receiving agent and added in its event base.
External Action

\[
\langle \text{external action} \rangle = \text{"@"} \langle \text{ident} \rangle \text{"("} \langle \text{atom} \rangle \text{","} \langle \text{Var} \rangle \text{")}\rangle;
\]

**Example:**

@blockworld( pickup( ), L1 )

Execute the action `pickup()` in the environment `blockworld`. The return value is stored in `L1`.
Abstract Action

\[ \langle \text{abstractaction} \rangle = \langle \text{atom} \rangle ; \]

**Example:**

\text{goto}( \text{X, Y} )

Executes the plan \text{goto}( \text{X, Y} ).
Test Action

\[
\langle \text{test} \rangle = \text{''B''}(\langle \text{belquery} \rangle)'' \\
| \text{''G''}(\langle \text{goalquery} \rangle)'' \\
| \langle \text{test} \rangle \& \langle \text{test} \rangle;
\]

Example:

\begin{align*}
\text{B( bomb (3,3) )} \\
\text{G( clean(blockworld) )} \\
\text{B( POS = [ X , Y ] )};
\end{align*}

\[\rightsquigarrow\] Prolog queries to belief- and goal-base
Adopt Goal Action

\[
\langle\text{adoptgoal}\rangle = \text{"adopta(""}\langle\text{goalvar}\rangle\text{")}
\left|\text{"adoptz(""}\langle\text{goalvar}\rangle\text{")}\right.
\]

Example:

\text{adopta( clean( blockWorld ) )}
\text{adoptz( clean( blockWorld ) )}
Drop Goal Action

\[
\langle \text{dropgoal} \rangle = \\
\quad \text{''dropgoal(''} \langle \text{goalvar} \rangle \text{'')} \\
\quad \text{|} \\
\quad \\
\quad \text{''dropsubgoals(''} \langle \text{goalvar} \rangle \text{'')} \\
\quad \text{''}
\]

Example:

dropgoal( clean( blockWorld ) )
About Goal Actions

- As the goal base of an agent is defined as a list, `adopta(\phi)` action adds goal \( \phi \) to the begin of goal base and `adoptz(\phi)` adds it to the end of the goal base.
- If the goal is already believed, the adopt goal action fails.
- Goals can be dropped and removed from the goal base by means of `dropgoal(\phi)`, `dropsubgoals(\phi)`, and `dropsupergoals(\phi)` actions.
- The first action removes the goal \( \phi \) from the goal base, the second action removes all subgoals of the goals \( \phi \) from the goal base, and the third action removes all goals that entail the goal \( \phi \) from the goal base. These actions succeeds always.
Plan Operators

Basic actions can be composed using operators for

- sequence,
- conditional choice,
- conditional iteration, and
- atomic plans.
Plan Operators

\[
\langle \text{plans} \rangle = \langle \text{plan} \rangle \{ \text{",", } \langle \text{plan} \rangle \} ; \\
\langle \text{plan} \rangle = \langle \text{baction} \rangle | \langle \text{sequenceplan} \rangle | \langle \text{ifplan} \rangle | \langle \text{whileplan} \rangle \\
| \langle \text{atomicplan} \rangle ;
\]
Sequence

\[\langle \text{sequenceplan} \rangle = \langle \text{plan} \rangle \ "\ ;\" \langle \text{plan} \rangle ;\]

**Example:**

goto( 0, 0 );  
@blockworld( drop( ), L2 );  
Drop( )
Conditional Choice

\(<ifplan> = "if" <test> "then" <scopeplan> ["else" <scopeplan>] ;\)

Example:

\(\text{if } B ( \textbf{not} \text{ bomb}( A, B ) ) \text{ then} \)
\{
  \text{AddBomb}( X, Y ) ;
  \text{adoptz( clean( blockWorld ) )}
\}
\text{else}
\{
  \text{AddBomb}( X, Y )
\}
Conditional Iteration

\[ \langle \text{whileplan} \rangle = \langle \text{while} \rangle \langle \text{test} \rangle \langle \text{do} \rangle \langle \text{scopeplan} \rangle ; \]

**Example:**

```plaintext
while G(clean(blockworld)) do
{
    skip
}
```
Atomic Plan

\[ \langle atomicplan \rangle = \"[\" \langle plan \rangle \\"]\" ; \]

Example:

\[
[AddBomb( X, Y ) ;
adoptz( clean( blockWorld ) )]
\]
Plans Example 1

{ 
goto( X, Y );
@blockworld( pickup( ), L1 );
PickUp( );
RemoveBomb( X, Y );
goto( 0, 0 );
@blockworld( drop( ), L2 );
Drop( )
}
Plans Example 2

{  
  if B( not bomb( A, B ) ) then
  {
    AddBomb( X, Y );
    adoptz( clean( blockWorld ) )
  }  
  else
  {
    AddBomb( X, Y )
  }
}
Initial Plans vs Reasoning Rule Plans

An initial plan:

Plans:
{
    B(start(X,Y)) ; @blockworld( enter(X, Y, blue ), L )
}
Data Structures

- Goal Base
- Belief Base
- Planning Goal Rule Base
- Plan Base
- Procedural Rule Base
- Event Base
- Deliberation Process
- Plan Repair Rule Base
- Belief Updates
Reasoning Rules

Planning Goal Rules (PG Rules): generate plans if an agent has certain goals and beliefs.

Procedural Rules (PC Rules): generate plans as a response to the reception of a message, events generated by the external environment(s), and the execution of abstract actions.

Plan Repair Rules (PR Rules): generate plans if an agent’s action fails.
Data Structures

- Goal Base
- Belief Base
- Planning Goal Rule Base
- Plan Base
- Procedural Rule Base
- Event Base
- Belief Updates
- Plan Repair Rule Base

Deliberation Process
Planning Goal Rules (PG Rules)

\[ \langle \text{pgrules} \rangle = \langle \text{pgrule} \rangle + ; \]
\[ \langle \text{pgrule} \rangle = [\langle \text{goalquery} \rangle] "<-" \langle \text{belquery} \rangle "|" \langle \text{plan} \rangle ; \]
PG Rules Example

**PG rules:**

\[
\text{clean( blockWorld ) } \leftarrow \text{bomb( X, Y ) |} \\
\{ \\
\quad \text{goto( X, Y );} \\
\quad \text{@blockworld( pickup( ), L1 );} \\
\quad \text{PickUp( );} \\
\quad \text{RemoveBomb( X, Y );} \\
\quad \text{goto( 0, 0 );} \\
\quad \text{@blockworld( drop( ), L2 );} \\
\quad \text{Drop( )} \\
\}
\]
Data Structures

- Goal Base
- Belief Base
- Planning Goal Rule Base
- Procedural Rule Base
- Plan Repair Rule Base
- Event Base
- Belief Updates
- Plan Base
- Deliberation Process
Events

There are three kinds of events:
- incoming messages,
- events from the external environment, and
- abstract action execution.
Data Structures

- Goal Base
- Belief Base
- Planning Goal Rule Base
- Plan Base
- Deliberation Process
- Procedural Rule Base
- Event Base
- Belief Updates
- Plan Repair Rule Base
Procedural Rules (PC Rules)

\[
\langle pcrules \rangle = \langle pcrule \rangle + ; \\
\langle pcrule \rangle = \langle atom \rangle "\langle belquery \rangle | \langle plan \rangle \";
\]

Prof. Dr. Jürgen Dix  ·  Department of Informatics, TUC
PC Rules Example (received message)

**PC-rules:**

\[
\text{message}( \text{sally, inform, La, On, bombAt( X, Y )}) \\
\leftarrow \text{true} \mid \{
\text{if B( not bomb( A, B ) ) then}
\{
\text{AddBomb( X, Y );}
\text{adoptz( clean( blockWorld ) )}
\}
\text{else}
\{
\text{AddBomb( X, Y )}
\}
\}
\]
PC Rules Example (external event)

PC-rules:

\[
\text{event} ( \text{simResult}(R), \text{Env} ) \leftarrow \text{true} \mid \{
\begin{align*}
    &\text{print} ("Simulation is over."); \\
    &\text{print} (R)
\end{align*}
\}
\]
PC Rules Example (abstract action)

**PC-rules:**

goto( X, Y ) ← true |
{
   @blockworld( sensePosition(), POS );
   B(POS = [A,B]);
   if B(A > X) then
   {
      @blockworld( west(), L );
      goto( X, Y )
   }
   else if B(A < X) then
   {
      @blockworld( east(), L );
      goto( X, Y )
   }
...
Data Structures

Goal Base ➔ Belief Base ➔ Planning Goal Rule Base

Plan Base ➔ Deliberation Process ➔ Procedural Rule Base

Event Base ➔ Belief Updates ➔ Plan Repair Rule Base

Deliberation Process
Plan Repair Rules (PR Rules)

\[ \langle prrules \rangle = \langle prrule \rangle + ; \]
\[ \langle prrule \rangle = \langle planvar \rangle ' <- ' \langle belquery \rangle ' | ' \langle planvar \rangle ; \]
PR Rules Example

PR−rules:
@blockworld( pickup( ) , L ) ; REST
← true | {
  @blockworld( sensePosition( ) , POS ) ;
  B( POS = [ X , Y ] );
  RemoveBomb( X , Y )
}
Data Structures

- Goal Base
- Belief Base
- Planning Goal Rule Base
- Plan Base
- Procedural Rule Base
- Event Base
- Belief Updates
- Plan Repair Rule Base

Deliberation Process
Deliberation Process

1. Start
2. Apply all PG rules
3. Execute first action of all plans
4. Process External Events
5. Process Internal Events
6. Process Messages
7. Sleep until external events or messages arrive
8. Rules Applied, Plans Executed, Events or Messages Processed?
   - No: Return to Start
   - Yes: Remove Reached Goals

Diagram:
- Start -> Apply all PG rules
- Apply all PG rules -> Execute first action of all plans
- Execute first action of all plans -> Process External Events
- Process External Events -> Process Internal Events
- Process Internal Events -> Process Messages
- Process Messages -> Sleep until external events or messages arrive
- Sleep until external events or messages arrive -> Rules Applied, Plans Executed, Events or Messages Processed?
  - No: Return to Start
  - Yes: Remove Reached Goals
